Resetting a User Password

Reset the password for a single account, for multiple accounts, or for all accounts in an OCI IAM identity domain.

When you request a password change, a notification is sent to the user or users so that they can provide a new password for the account. The user clicks the link in the notification to open a form where they provide a new password. The new password must conform to the password policy as defined by an administrator.

You can't reset the passwords for deactivated user accounts. To activate one or more deactivated accounts, search for accounts with a status of *Inactive*. Then, select individual accounts to activate, or select them all.

1. On the **Domains** list page, select the domain for which you want to reset passwords. If you need help finding the list page for the domain, see [Listing Identity Domains](#).
2. On the details page, perform one of the following actions depending on the option that you see:
 - Select the **User management** tab, and then go to the **User** section of the tab.
 - Under **Identity domain** on the left side of the page, select **Users**.
3. Select the checkbox of each user account for which to reset the password.

Tip

To reset the passwords for all user accounts, don't select any checkboxes, and skip to the next step.

4. Depending on what options you see, select **Actions** or **More actions**, and then perform one of the following:
 - If you selected one or more user accounts, select **Reset password**. Then, in the Reset password dialog box, select **Reset password**.
 - To reset the passwords for all accounts, select **Reset all passwords**. Then, in the Reset all passwords dialog box, select **Reset all passwords**.

Note

For information about managing users and passwords on Oracle Autonomous AI Database Serverless, see the section on creating users in [*Using Oracle Autonomous AI Database Serverless*](#).
